BLOCKODE
Leading Software Company in Malaysia with Top Software Developers and Engineers. Empowering Your Business with Technology – Make Technology Work For You.

ABOUT

Blockode is a leading technology-oriented company in Malaysia, offering innovative software services to help businesses improve their operations. With a focus on excellence in client relationships, Blockode aims to become a global leader in bridging the gap between business solutions and technology.

As a pioneer in the field of blockchain technology, Blockode recognizes the potential of decentralizing power through the use of smart contracts. By utilizing this technology, businesses can experience a paradigm shift that will lead to increased economic exchange and prosperity. Blockode is passionate about developing unique, clean, and usable decentralized applications to help businesses achieve their goals.

VISION

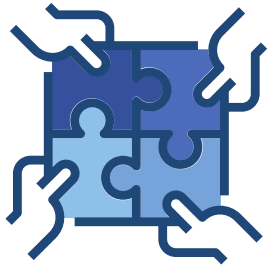
To provide this world a better technology system. Our aim is to provide best-of-breed business solutions for companies we serve leveraging the technology.

MISSION

To make software a positive social and economic force that can empower business, create new economic value and empower the network of companies to ensure a stable working environment for end users.

CORE VALUES

Integrity

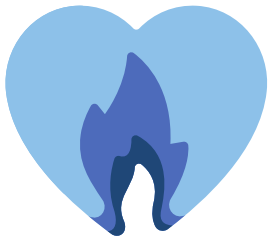


Teamwork

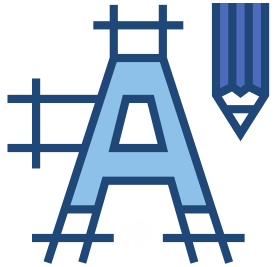
Focus

Curiosity

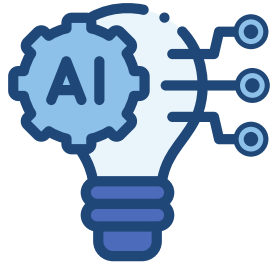
Quality



Passion



Creativity



Innovation

PAINS

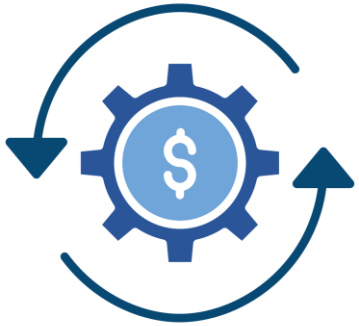
Lack of technical expertise

Lack of competitive advantages

Unnecessary cost on businesses

Lack of leverage technologies

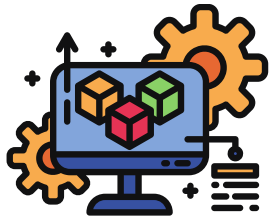
Lack of credibility



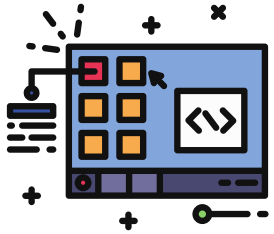
Sales revenue declining

TOP 8 SERVICES

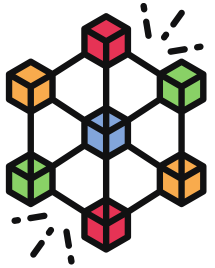
Mobile App Development



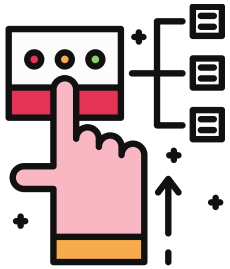
Web App Development



Desktop App Development



Blockchain Dapp Development



Server Management

Cybersecurity

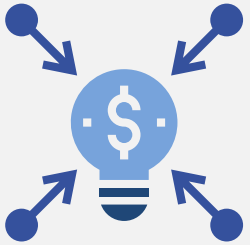
Tech Consultation

Digital Marketing

APPROPRIATE

Startups

We know what it takes
to help startups succeed.



Enterprise

Award-winning answers
for big businesses.

Government

Small and large-scale
government solutions.

Non-Profit

We do good work for those
who do good for others.

Exceptional Quality

A front-runner in high-performance.
new-age development, we specialize
in creating quality applications that
are unique and fully-featured.

Competitive Pricing

Without compromising on the
performance and quality front,
we offer our development services
at prices most affordable
and competitive.

Domain Experts

Our highly proficient and
extensively skilled developers
work in close coordination with
you to built apps that take you
closer to your goals.

REVIEWS

It really saves me time and effort. This is exactly what our business has been lacking. I am completely blown away.

Lixue Yao

I am so pleased with the software they developed. The very best. Great job, I will definitely be ordering again!

Inaaya bin Nadiyya

Thanks for the great service. It is the real deal! Thank you so much for your help.

Desmond Lee

APPROACH

Requirements

The first step is to understand the need of new system and/or comprehend the existing system to suggest variations. We undertake a detailed study of your problems to know where the system lacks. This process involves collecting significant data and raw information which becomes the basis of our analysis. The strategy is to acknowledge every bit of your requirements based on the gathered data and come up with suggestions for refinement and evolving systems with widened functionality. Our strategic workflow has helped us become one of the top service providers in Malaysia.

APPROACH

Design

With successful initial analysis, the process is now put to designing to be shaped into a physical system. The theoretical researches of the system's specifications are examined to conclude the various designing aspects. This will include the computing programming language and the IDE to be used. Hardware configuration, control processes, the way of data organization, information flow through the system and the layout are also decided at this stage. The onset of the design phase involves framing the primary structure of the system along with fundamental facets of system protocols and guidelines.

APPROACH

Build

The next stage in the life cycle of this revolution is implementing the formulated design with techniques that best suit the development policy. Coding is an important part of this phase and our experienced programmers have to ability to perform this task amazingly well. Our programmers will formulate and structure modules, procedures along with functions that fulfill the purpose of the system. Building efficient algorithms and effective assembly of code dictates the measure of our outstanding performance. The objective is to write error-free and flexible code that can entertain future enhancements. With the best technical team, we guarantee services par excellence and at affordable servicing cost.

APPROACH

Test

The certainty of the system is thoroughly checked before it is launched or deployed. It becomes imperative to demonstrate that the constraints of the program are constantly credible irrespective of the situational or contextual variances. For this, the system is checked for its performance in various circumstances with multiple data inputs. After a successful test run, the user is allowed an attempt to mold the inputs as per their requirements and then approve the system upon satisfaction.

APPROACH

Release

This phase is where we actually put up the product in the market for users to take advantage of it. After surviving through all the phases of the software development the raw system becomes a full-fledged product. This is now exposed to users to gather their inputs, process and synchronize it with constraints to produce the expected output. The previously documented manuals and user guide of the system are made public. The product is live now serves users and collects valuable feedback for future amendments.

APPROACH

Maintenance

To be able to look after what is built is an important virtue of any production. Maintenance thus becomes considerably crucial. After deploying the product, a periodic check on its working life is the next task. The product feedbacks are keenly analyzed to enhance it to address new difficulties faced by the user. One can never achieve an ideal product because changes are natural and absolute. A team dedicated to discovering yet newer versions of the existing product is always on work.
